COMET P/2008 QP 20 (LINEAR-HILL)
R. E. Hill reports his discovery of a comet on Catalina Sky Survey unfiltered CCD images taken with the $0.68-\mathrm{m}$ Schmidt telescope, the object showing a well-condensed coma of diameter $6^{\prime \prime}-8^{\prime \prime}$ and a narrow $18^{\prime \prime}$ tail in p.a. $250^{\circ}$ in four stacked 30-s exposures in $3^{\prime \prime}-4^{\prime \prime}$ seeing (discovery observation tabulated below, though with magnitude added from Sept. 23.279 UT image); his stacked 60 -s images from Sept. 24.3 show the comet to be well condensed with an elongated nuclear condensation with coma size $12^{\prime \prime} \times$ $20^{\prime \prime}$ and a narrow $4^{\prime}$ tail in p.a. $260^{\circ}$. Following posting on the Minor Planet Center's 'NEOCP' webpage, numerous other CCD astrometrists have reported this object to show cometary appearance, and at this point, K. Smalley (Minor Planet Center) identified Hill's comet with an apparently asteroidal object discovered by LINEAR and designated $2008 \mathrm{QP}_{20}$ on MPS 255263 (discovery observation also tabulated below). G. Muler (Lanzarate, Spain, $0.30-\mathrm{m}$ Schmidt-Cassegrain reflector) writes that fifteen co-added 130 -s exposures on Sept. 24.06 show a tail $\sim 29^{\prime \prime}$ long in p.a. $245^{\circ} .2$. J. E. McGaha (Tucson, AZ, U.S.A., $0.62-\mathrm{m} f / 5.1$ reflector) reports that a $180-\mathrm{s}$ exposure from Sept. 24.2 shows a bright, round $7^{\prime \prime}$ coma with a narrow $44^{\prime \prime}$ tail in p.a. $243^{\circ}$. H. Devore measured a $52^{\prime \prime} .5$ tail in p.a. $241^{\circ}$ from exposures taken by R. Holmes (Charleston, IL, U.S.A., 0.61-m f/4.0 astrograph) on Sept. 24.34-24.36. E. Guido, Castellammare di Stabia, Italy, notes that forty unfiltered co-added 60-s exposures taken remotely by G. Sostero, P. Camilleri, and himself ( $0.25-\mathrm{m} f / 3.4$ reflector located near Mayhill, NM, U.S.A.) on Sept. 24.4 show a coma $\sim 10^{\prime \prime}$ in diameter and a narrow tail $\sim 30^{\prime \prime}$ long in p.a. $233^{\circ}$. D. T. Durig (Sewanee, TN, U.S.A., $0.30-\mathrm{m} f / 2.5$ Schmidt-Cassegrain reflector, Sept. 24.4, twenty 120-s co-added exposures) reports a tail $\sim 65^{\prime \prime}$ long in p.a. $245^{\circ}$. A. C. Gilmore and P. M. Kilmartin (Mt. John $1.0-\mathrm{m} f / 7.7$ reflector, Sept. 24.5 , poor seeing) write that the object shows a stellar head and a tail $\sim 40^{\prime \prime}$ long in p.a. $240^{\circ}$.
